EISec 2018

SETTING THE SCENE

- By 2020, five RSC services are implemented across Europe, adhering to the 2015 TSOs' MLA, complying with legal provisions from 2017 EU legislation, meeting the needs of
→ fit-for-purpose European transmission
- Establishing effective and robust
→ cost sharing for remedial actions must complement services, for what active involvement of NRA is essential
- The RSCs setup & paradigm are proven indispensable for this development, as was
→ demonstrated in critical grid situations during summer 2015 and winter 2017

MAKING IT HAPPEN

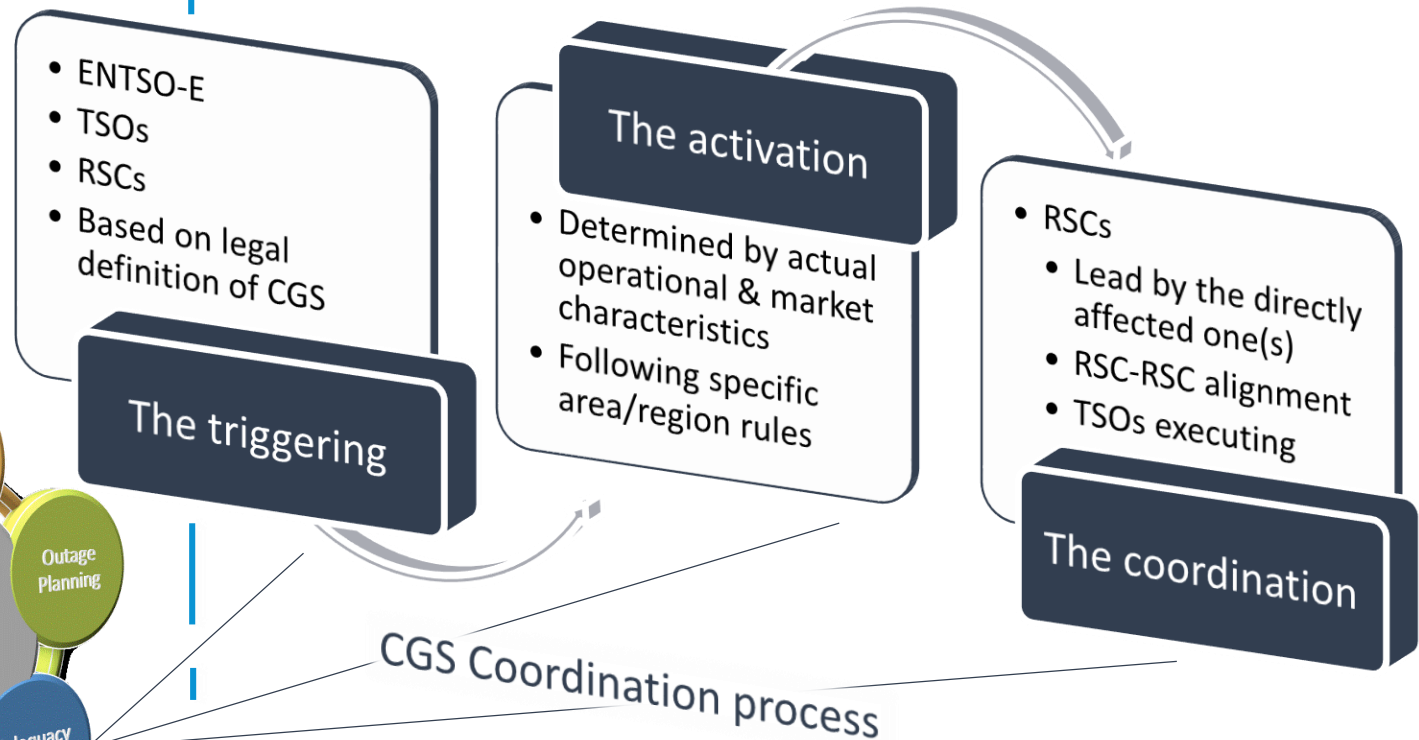

LESSONS LEARNED IN PRACTICE

- RSCs substantially contributed to enhanced regional awareness & coordination during critical situations in European grids in the past (summer 2015, winter 2017)
- This has resulted 2018 in a new (group of) services for managing “Critical Grid Situations” before these escalate
- CGS service(s), linked to forecast, are important add-on to the “standard” and legally mandated set and are already in place!

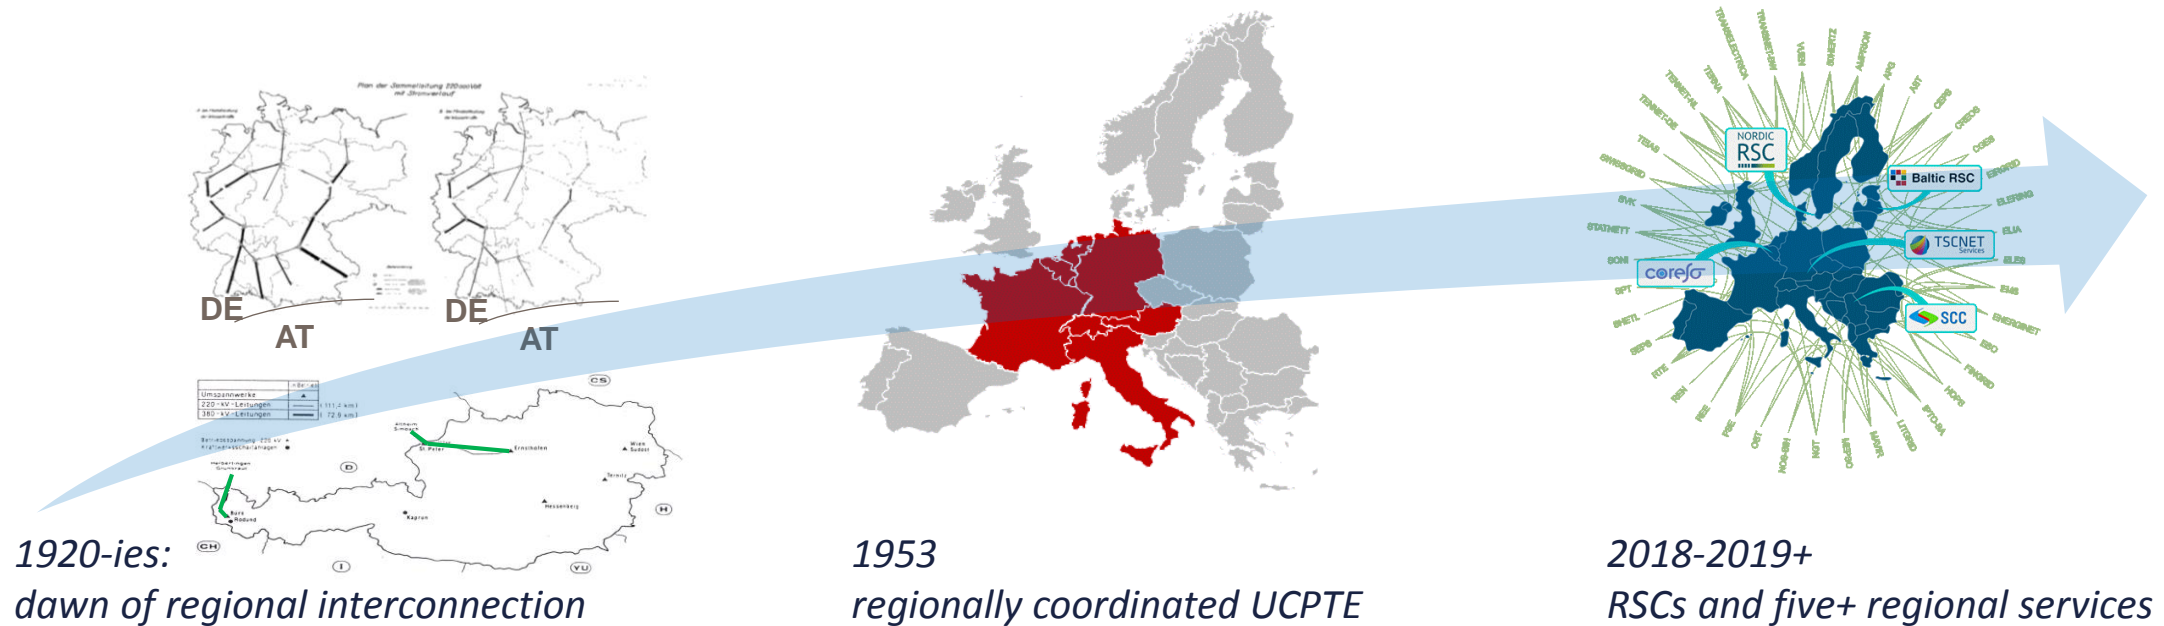

NEW SERVICE(S) ALREADY IN 2018!

FUTURE PROSPECTS

- Active involvement with stakeholders via System Operation Coordination Group and SO European Stakeholders' Committee is already well established, fruitful and delivers effective steering
- A flashback on the impressive past of European regional coordination, allows an optimistic view to the future, in the sense of:

Thinking globally (EU), acting locally (Member States' TSOs) and coordinating regionally (TSOs' RSCs)!

What do you think about it?
